Chapter 3 Notes for Masochists

Hitting decreased slightly in the National League last year and went up slightly in the American League. Denominators only needed small adjustments.

The process remains as simple as it always has been: figure out the average league last year, then the average team, then the average player. Assign values to the various stats and make sure they add up -- or divide down -- to \$13 for the average hitter.

To calculate the average league, five NLR's were used: Lookout Bush (TN), Couch Potatoes (FL), Out of Their League (VA), Pioneer Valley (MA) and High & Tight (CA). And five ALR's: Beizbol (SC), Lone Star (TX), Washington Ghost-AL (DC), Michael Menery (MA) and Tri Ds-Jamaica Plain (MA). The stats are from the hypothetical final standings; that is, just the stats of the players bought in auctions, the only stats that we pay for with the budgets of \$2600 and \$3120.

Draft populations, 1991 hitters:

| NL | AB | HR | RBI | SB | BA | \$HR | \$RBI | \$SB | \$BA | \$TOT |
|--------|-------|------|------|------|------|------|-------|------|------|-------|
| LOO | 48791 | 1261 | 6077 | 1399 | .263 | 573 | 742 | 493 | 0 | 1808 |
| CPL | 49681 | 1249 | 6134 | 1395 | .263 | 568 | 749 | 492 | 0 | 1809 |
| OTL | 50438 | 1261 | 6220 | 1441 | .263 | 573 | 760 | 508 | 0 | 1841 |
| PVL | 49458 | 1247 | 6126 | 1414 | .263 | 567 | 748 | 499 | 1 | 1814 |

| AL | AB | HR | RBI | SB | BA | \$HR | \$RBI | \$SB | \$BA | \$TOT |
|--------|-------|------|------|------|------|------|-------|------|------|-------|
| BZB | 63730 | 1714 | 8154 | 1287 | .263 | 701 | 900 | 585 | -1 | 2185 |
| LSL | 63833 | 1724 | 8162 | 1306 | .263 | 705 | 901 | 594 | -2 | 2198 |
| WGA | 63774 | 1697 | 8165 | 1314 | .264 | 694 | 901 | 597 | 0 | 2193 |
| MML | 63595 | 1667 | 8066 | 1323 | .264 | 682 | 890 | 601 | 1 | 2174 |
| TRD | 63329 | 1712 | 8132 | 1258 | .265 | 700 | 897 | 572 | 1 | 2171 |
| avg lg | 63652 | 1703 | 8136 | 1298 | .264 | 697 | 898 | 590 | 0 | 2184 |
| avg tm | 5304 | 142 | 678 | 108 | .264 | 58 | 75 | 49 | 0 | 182 |
| avg pl | 379 | 10 | 48 | 8 | .264 | 4 | 5 | 4 | 0 | 13.00 |

The inter-league differences should be apparent; the intra-league similarities should also be apparent.

The formulas for converting the stats into values for the NL hitters:

$$\text{\$HR} = 13 * (\text{HR} / 4.5) / 6.355$$

$$\text{\$RBI} = 13 * (\text{RBI} / 16.8) / 6.355$$

$$\text{\$SB} = 13 * (\text{SB} / 5.8) / 6.355$$

$$\text{\$BA} = 13 * (((1236 + \text{Hits}) / (4700 + \text{AB}) - 0.264) / 0.0012) / 6.355$$

The formulas for the AL hitters:

$$\begin{aligned} \$HR &= 13*(HR/5)/6.355 \\ \$RBI &= 13*(RBI/18.5)/6.355 \\ \$SB &= 13*(SB/4.5)/6.355 \\ \$BA &= 13*(((1240.8+Hits)/(4700+AB)-0.264)/0.0012)/6.355 \end{aligned}$$

To make the average hitter worth \$13.00, not \$13.02 or 12.99, I use more decimals than are shown. These will give any hitter the dollar values that are in this book. The key numbers are the ones in parentheses: the denominators. Close to six steals make a difference in the standings in the National League, whereas between four and five do in the American League.

The 6.355 is the amount the average hitter helps the typical Rotisserie team. If you take him away and carry only 13 hitters on your team, you will drop a little over six points in the standings.

As for the \$13 that I assign the average hitter, it all hinges on the way the game is scored: three quantitative categories for hitters, two for pitchers. The average hitter is a three-category player; he's worth 50% more than the average pitcher. Rather than equal salaries of \$11.3, the hitter earns \$13, 50% more than the \$8.67 the pitcher earns. The bookends of the equations simply convert every 6.355 points that a hitter contributes into \$13.

That's it for hitting. Changing the three quantitative denominators from year to year is exactly like Pete Palmer's linear weights: performance is put in the context of each year and each league.

Pitching has only one denominator that can legitimately be changed, and as a result the average pitcher just about refuses to earn exactly what he's supposed to.

Draft populations, 1991 pitchers:

| NL | IP | W | Sv | ERA | Rto | \$W | \$S | \$ERA | \$Rto | \$TOT | \$H&P |
|-------|-------|-----|-----|------|-------|-----|-----|-------|-------|-------|-------|
| LOO | 11521 | 678 | 355 | 3.57 | 11.46 | 555 | 234 | -2 | -2 | 785 | 2591 |
| CPL | 11066 | 670 | 433 | 3.51 | 11.31 | 548 | 286 | 1 | 2 | 837 | 2643 |

| AL | IP | W | Sv | ERA | Rto | \$W | \$S | \$ERA | \$Rto | \$TOT | \$H&P |
|-------|-------|-----|-----|------|-------|-----|-----|-------|-------|-------|-------|
| BZB | 12542 | 738 | 552 | 3.93 | 12.03 | 604 | 332 | 0 | 0 | 936 | 3125 |
| LSL | 12769 | 755 | 542 | 3.97 | 12.08 | 618 | 326 | -2 | -1 | 941 | 3143 |
| WGA | 12721 | 746 | 533 | 3.92 | 12.02 | 611 | 321 | 0 | 0 | 932 | 3129 |
| MML | 13089 | 774 | 537 | 3.91 | 12.01 | 634 | 323 | 1 | 1 | 958 | 3136 |
| TRD | 12816 | 756 | 504 | 3.92 | 11.99 | 619 | 303 | 0 | 1 | 924 | 3099 |
| av lg | 12787 | 754 | 534 | 3.93 | 12.03 | 617 | 321 | 0 | 0 | 938 | 3122 |
| av tm | 1066 | 63 | 44 | 3.93 | 12.03 | 51 | 27 | 0 | 0 | 78 | 260 |
| av pl | 118 | 7.0 | 4.9 | 3.93 | 12.03 | 6 | 3 | 0 | 0 | 8.70 | 11.3 |

Do you see? One average pitcher is worth \$9.11 and the other \$8.70. If you look at the wins columns, you'll understand why.

There are valid league differences and phony league differences. The different ERA's and ratios are valid, but since they both are worth zero to the average pitcher, changing those denominators -- even if I wanted to -- would accomplish nothing. The different number of saves that the two average players get is valid;

there were indeed more saves in the NL last year. But there weren't more wins. One to a ballgame, that's the limit.

The average NL Rotisserie team bought 68 wins in the draft; the average AL team bought 63 wins. More pitchers came along after the start of the season to win games in the AL; it could go the other way this year. The wins denominator must always be the same for each league, even if I have to sacrifice perfection. Pisses me off.

Three cents don't add up to a hill of beans in the AL, but as you can see, the 44 cents extra that the average pitcher is paid makes the average team earn \$264, which is not possible.

I could force the NL back down to size by raising the saves denominator; in effect, I could take money out of Lee Smith's pocket to pay for the five extra wins per team that were available in the draft -- ridiculous, misleading, and terribly tempting.

The saves denominator *can* change -- as long as it relates to the number of saves available, not wins -- and in both leagues it did change.

The formulas for NL pitchers:

$$\begin{aligned} \$W &= 8.67*(Wins/2.5)/4.237 \\ \$Sv &= 8.67*(Saves/3.1)/4.237 \\ \$ERA &= 8.67*((3.53-(412+ER))/((1050+IP)/9))/0.04/4.237 \\ \$Rto &= 8.67*((11.38-((1328+H+BB))/((1050+IP)/9)))/0.07/4.237 \end{aligned}$$

For AL pitchers:

$$\begin{aligned} \$W &= 8.67*(Wins/2.5)/4.237 \\ \$S &= 8.67*(Saves/3.4)/4.237 \\ \$ERA &= 8.67*((3.93-(459+ER))/((1050+IP)/9))/0.04/4.237 \\ \$Rto &= 8.67*((12.03-((1404+H+BB))/((1050+IP)/9)))/0.07/4.237 \end{aligned}$$

In 1990 the saves denominators were 2.7 for the NL and 3.8 for the AL. The drastic difference was a response to the scarcity of saves in the NL and the abundance in the AL. Last year saves went up in the NL, down in the AL; the gap was narrowed but not closed, and these new denominators try to reflect that.

This is the contraption. Now we can take it for a test drive.

| hitting | HIGH & TIGHT 1991 DRAFT | | | | | |
|--------------|-------------------------|------|------|------|------|------|
| | AB | HR | RBI | SB | BA | \$ |
| Kerrson | 5404 | 147 | 752 | 158 | .269 | 220 |
| Prima Donnas | 5013 | 129 | 619 | 117 | .276 | 187 |

| total | 50189 | 1258 | 6198 | 1410 | .263 | 1825 |

I'm deliberately taking it over a bumpy road. The High & Tight League, one of the phony start-up leagues used to calculate market prices in Appendix A, is the NLR that went the furthest over the salary cap in the calculations above. Let's try to run these guys over with Patton \$ or get rattled apart in the process.

| pitching | IP | W | S | ERA | Rto | \$ | \$TOT | Pts |
|--------------|-------|-----|-----|------|-------|-----|-------|-------|
| Kerrson | 1081 | 60 | 50 | 3.73 | 11.14 | 80 | 301 | 59.0 |
| Prima Donnas | 1666 | 102 | 20 | 3.33 | 11.23 | 106 | 292 | 54.5 |
| Foreplay | 1258 | 80 | 44 | 3.45 | 11.31 | 98 | 294 | 53.5 |
| Doors | 1068 | 75 | 70 | 3.01 | 10.89 | 128 | 276 | 45.0 |
| 3 Scrooges | 740 | 30 | 68 | 3.97 | 12.58 | 46 | 266 | 43.5 |
| Big Bucks | 902 | 48 | 16 | 3.31 | 11.46 | 54 | 241 | 42.5 |
| Hooters | 1458 | 99 | 33 | 3.40 | 11.35 | 107 | 262 | 41.0 |
| Scratchers | 1104 | 68 | 63 | 3.84 | 11.34 | 90 | 271 | 38.0 |
| Shamrocks | 989 | 54 | 57 | 3.61 | 11.52 | 78 | 237 | 34.0 |
| Double Play | 1007 | 59 | 12 | 3.50 | 11.84 | 50 | 219 | 29.0 |
| total | 11274 | 675 | 433 | 3.49 | 11.41 | 839 | 2664 | 440.0 |

Their pitching is odd: strong in saves and ERA, average in wins, weak in ratio. There are obviously different games being played within the game. The Prima Donnas loaded up on starting pitching and got away with it (the second best ERA). The Doors loaded up on relievers and got what they were looking for (the best ERA, as well as ratio). The Three Scrooges tried a more extreme version of the Doors' game; are last in ERA and ratio and are 260 innings short of 1000. Only one team has as much hitting as they do, however, so they may be able to trade their way out of this mess.

In the total earnings column we see inflation taking its toll. Only three teams earn less than \$260, the break-even point. On the other hand, the inflation factor itself is only 2.5%, and it's all concentrated in pitchers, whom we have no trouble deflating in the auction. For hitters as a group, the prices are valid within \$5; they are 99.7% accurate.

The points show how these teams finished in the hypothetical final standings. Despite the various crackpot strategies -- look at the Scratchers playing Whitey ball -- there's a pretty good correlation between the hypothetical order of finish and the dollar value of their stats. If the Scratchers can show Whitey how to make a trade, they'll be fine.

| hitting | HIGH & TIGHT 1991 FINAL | | | | | |
|--------------|-------------------------|------|------|------|------|------|
| | AB | HR | RBI | SB | BA | \$ |
| Prima Donnas | 5789 | 136 | 680 | 140 | .269 | 200 |
| Doors | 5441 | 147 | 708 | 166 | .264 | 212 |
| Foreplay | 5488 | 151 | 750 | 141 | .253 | 201 |
| 3 Scrooges | 6192 | 170 | 752 | 209 | .269 | 248 |
| Kerrson | 5552 | 137 | 729 | 180 | .265 | 217 |
| Hooters | 5041 | 131 | 580 | 91 | .266 | 165 |
| Scratchers | 5437 | 97 | 593 | 202 | .257 | 182 |
| Big Bucks | 5081 | 116 | 588 | 155 | .254 | 171 |
| Shamrocks | 4788 | 120 | 544 | 154 | .254 | 167 |
| Double Play | 4725 | 107 | 587 | 91 | .263 | 152 |
| total | 53534 | 1312 | 6511 | 1529 | .262 | 1929 |

The Scratchers have given up 24 steals and gained 8 home runs: a fair exchange in real baseball, but not good enough for their needs. The Three Scrooges are now far the best hitting team; they played it wrong. The league has gained \$104 in hitting, but Double Play has lost \$17: a three-category punt and maybe a fire sale.

| pitching | IP | W | S | ERA | Rto | \$ | \$TOT | Pts | +/- |
|--------------|-------|-----|-----|------|-------|-----|-------|-------|-------|
| Prima Donnas | 1492 | 97 | 54 | 3.15 | 11.10 | 131 | 331 | 62.0 | 7.5 |
| Doors | 1353 | 89 | 43 | 3.17 | 11.02 | 118 | 330 | 60.0 | 15.0 |
| Foreplay | 1383 | 91 | 44 | 3.37 | 11.30 | 110 | 311 | 54.0 | 0.5 |
| 3 Scrooges | 981 | 45 | 65 | 4.11 | 12.56 | 49 | 297 | 52.0 | 8.5 |
| Kerrson | 1342 | 72 | 50 | 3.88 | 11.40 | 82 | 299 | 51.0 | -8.0 |
| Hooters | 1335 | 87 | 34 | 3.58 | 11.36 | 93 | 258 | 39.5 | -1.5 |
| Scratchers | 1289 | 78 | 64 | 3.98 | 11.66 | 89 | 271 | 39.0 | 1.0 |
| Big Bucks | 1070 | 64 | 32 | 3.43 | 11.49 | 74 | 246 | 32.0 | -10.5 |
| Shamrocks | 1132 | 65 | 35 | 3.74 | 11.47 | 69 | 237 | 29.0 | -5.0 |
| Double Play | 1062 | 62 | 12 | 3.68 | 11.89 | 47 | 200 | 21.5 | -7.5 |
| total | 12441 | 750 | 433 | 3.58 | 11.48 | 894 | 2823 | 440.0 | 0.0 |

So these are the final standings. "+/-" shows who gained and lost how many points. The Prima Donnas, who made five trades, gave up five wins, gained 34 saves, and even improved on their ERA and ratio, which may be the two categories where there's never a surplus. The Doors gave them a heck of a chase: gave up \$10 in pitching (27 saves), gained \$65 in hitting (183 ribbies), and gained 15 points in the standings, falling two points short. Double Play hung in there, sort of, losing only \$3 in pitching. The Three Scrooges didn't make a thousand innings, but I don't know if there was a penalty.

In any event, points and dollars now line up very nicely. Give Kerrson one-and-a-half more points and the Scratchers one more point and everything would be just so; leagues always try to straighten out their assets during the season and make Patton \$ look better.

What they are attempting to do, of course, is change their destiny. We can easily see all the huffing and puffing after the draft if we subtract the draft stats from the final stats for each team, then sort the teams by who picked up the most AB and IP, either through trades, waivers or reserve lists.

| hitting | AB | HR | RBI | SB | BA | \$HR | \$RBI | \$SB | \$BA | \$TOT |

| pitching | IP | W | S | ERA | Rto | \$W | \$S | \$ERA | \$Rto | \$TOT |
|--------------|------|-----|-----|------|-------|-----|-----|-------|-------|-------|
| Doors | 284 | 14 | -27 | 3.77 | 11.49 | 11 | -18 | -3 | -1 | -10 |
| Kerrson | 261 | 12 | 0 | 4.48 | 12.48 | 10 | 0 | -10 | -6 | -6 |
| 3 Scrooges | 242 | 15 | -3 | 4.54 | 12.48 | 12 | -2 | -10 | -6 | -5 |
| Scratchers | 185 | 10 | 1 | 4.82 | 13.57 | 8 | 1 | -10 | -10 | -11 |
| Big Bucks | 168 | 16 | 16 | 4.06 | 11.66 | 13 | 11 | -4 | -1 | 19 |
| Shamrocks | 144 | 11 | -22 | 4.57 | 11.09 | 9 | -15 | -6 | 1 | -11 |
| Foreplay | 125 | 11 | 0 | 2.60 | 11.19 | 9 | 0 | 5 | 1 | 15 |
| Double Play | 55 | 3 | 0 | 6.87 | 12.93 | 2 | 0 | -9 | -2 | -8 |
| Hooters | -123 | -12 | 1 | 1.46 | 11.31 | -10 | 1 | -14 | 0 | -24 |
| Prima Donnas | -174 | -5 | 34 | 4.92 | 12.28 | -4 | 22 | 14 | 5 | 38 |
| total | 1167 | 75 | 0 | 4.49 | 12.16 | 61 | 0 | -26 | -12 | 24 |

Easy to see, yes. Easy to understand, no.

How can the Hooters lose 123 innings and gain such a terrific ERA? Maybe, since the ERA is worth minus \$14, it means they gave this terrific ERA to another team. The Prima Donnas gained \$14 by giving terrible pitching to another team.

One thing that jumps out is that there was not a single save gained overall; many swapped, but the same total as in the hypothetical. No Wohlers added? Wohlers added and Schilling dropped, perhaps? This league was no dynamo, but it made 66 trades, 58 reserve list moves, and 45 waiver claims, picking up value in all the other categories.

Well, quantitative categories. The new pitchers were two-category disasters, and the batters weren't that great; 313 RBI's spread among ten teams don't go very far.

But they aren't spread equally; that's the key. No one huffed and puffed harder than the Doors -- 19 trades, 5 reserve moves, 10 waivers -- and they picked up the most at-bats and innings. The transaction line for the Prima Donnas only reads 5, 9, 5, but they picked up the second most at-bats and subtracted the most innings. Clearly, their strategy was to help themselves by hurting others.

It almost worked. Kerrson only made two trades and a total of 10 transactions. But they gave up a lot of hitting to gain 261 innings worth minus \$6. The Three Scrooges picked up the next most innings, the Scratchers the next most. These three teams -- honest gamesters, trying to improve their hands -- together piled up 688 innings and lost \$22 that they could have kept by doing nothing.

Quantities of quantity are bound to help; quantities of quality, not necessarily -- that's the Stage Three motto. Whether High & Tight was in fact a Stage Three start-up league can be readily determined. Here they are, ranked by who spent the most on hitting:

| hitters | paid | earned | net | AB | HR | RBI | SB | BA | fin. |
|--------------|------|--------|-----|-------|------|------|------|------|------|
| Prima Donnas | 198 | 187 | -11 | 5013 | 129 | 619 | 117 | .276 | 1 |
| Double Play | 191 | 169 | -22 | 5088 | 114 | 637 | 108 | .264 | 10 |
| Kerrson | 185 | 220 | 35 | 5404 | 147 | 752 | 158 | .269 | 5 |
| Big Bucks | 178 | 187 | 9 | 5044 | 149 | 692 | 117 | .256 | 8 |
| Shamrocks | 172 | 160 | -12 | 4358 | 115 | 533 | 133 | .257 | 9 |
| Doors | 168 | 147 | -21 | 4322 | 112 | 525 | 109 | .255 | 2 |
| 3 Scrooges | 163 | 220 | 57 | 5567 | 143 | 642 | 204 | .269 | 4 |
| Foreplay | 162 | 196 | 34 | 5176 | 143 | 700 | 144 | .257 | 3 |
| Hooters | 152 | 155 | 3 | 4893 | 117 | 541 | 94 | .265 | 6 |
| Scratchers | 146 | 181 | 35 | 5324 | 89 | 557 | 226 | .255 | 7 |
| total | 1715 | 1825 | 110 | 50189 | 1258 | 6198 | 1410 | .263 | 55 |

The league spent \$1715 on hitting, much less than the \$1820 that I maintain hitters will inevitably earn (\$13 X 140 hitters). Still, \$1715 is closer to \$1820 than \$1582, which is what a Stage One league spends (\$11.3 X 140 hitters). The Prima Donnas spend the most on hitting and finish first, the Double Plays the second most and finish last, so that's not too instructive. The Scratchers spent the least amount on hitting and, except for stolen bases, certainly got the least amount. They paid \$26 for DeShields and \$21 for Otis Nixon; it can't be said that the league undervalued steals.

| pitchers | paid | earned | net | IP | W | S | ERA | Rto | fin. |
|------------|------|--------|-----|------|----|----|------|-------|------|
| Scratchers | 114 | 90 | -24 | 1104 | 68 | 63 | 3.84 | 11.34 | 7 |
| Hooters | 107 | 107 | 0 | 1458 | 99 | 33 | 3.40 | 11.35 | 6 |
| Foreplay | 95 | 98 | 3 | 1258 | 80 | 44 | 3.45 | 11.31 | 3 |
| 3 Scrooges | 94 | 46 | -48 | 740 | 30 | 68 | 3.97 | 12.58 | 4 |

| pitchers | paid | earned | net | IP | W | S | ERA | Rto | fin. |
|--------------|------|--------|-----|-------|-----|-----|------|-------|------|
| Doors | 92 | 128 | 36 | 1068 | 75 | 70 | 3.01 | 10.89 | 2 |
| Shamrocks | 87 | 78 | -9 | 989 | 54 | 57 | 3.61 | 11.52 | 9 |
| Big Bucks | 82 | 54 | -28 | 902 | 48 | 16 | 3.31 | 11.46 | 8 |
| Kerrson | 75 | 80 | 5 | 1081 | 60 | 50 | 3.73 | 11.14 | 5 |
| Double Play | 68 | 50 | -18 | 1007 | 59 | 12 | 3.50 | 11.84 | 10 |
| Prima Donnas | 61 | 106 | 45 | 1666 | 102 | 20 | 3.33 | 11.23 | 1 |
| total | 875 | 839 | -36 | 11274 | 675 | 433 | 3.49 | 11.41 | 55 |

Naturally, the teams that spend the least on hitting spend the most on pitching, and if by my lights they underspend on hitters, they overspend on pitchers. But by any reckoning, big spenders like the Scratchers clearly don't get what they paid for; on the other hand, neither do little spenders, like the Big Bucks.

Perhaps some sense can be made of this buy averaging the top five and bottom five teams in each list.

| \$ on hitting | paid | earned | net | AB | HR | RBI | SB | BA | fin. |
|----------------|------|--------|-----|------|-----|-----|-----|-------|------|
| top 5 (avg) | 185 | 184 | -1 | 4981 | 131 | 647 | 127 | 0.265 | 6.6 |
| bottom 5 (avg) | 158 | 180 | 22 | 5056 | 121 | 593 | 155 | 0.260 | 4.4 |

The teams that spend the most do get the most hitting, but it's much closer than I would have thought. Most peculiar is the fact that the cheapskates actually pack more AB onto their teams. This can happen in Stage One auctions when teams bid furiously on the stars, but the best hitters, the presumed best hitters, really weren't that expensive: Bonds \$43 (Big Bucks), Strawberry \$40 (Doors), Eric Davis \$39 (Foreplay), Gant \$39 (Big Bucks) and Sandberg \$39 (Prima Donnas).

| \$ on pitching | paid | earned | net | IP | W | S | ERA | Rto | fin. |
|----------------|------|--------|-----|------|----|----|------|-------|------|
| top 5 (avg) | 100 | 93 | -7 | 1126 | 70 | 56 | 3.50 | 11.41 | 4.4 |
| bottom 5 (avg) | 75 | 74 | -1 | 1129 | 65 | 31 | 3.49 | 11.41 | 6.6 |

More very strange stuff. The cheapskates buy a few more innings and, amazingly, get a slightly better ERA. But the big spenders get a 93% return on their dollar -- primarily by scarfing up most of the saves -- and as a group fare substantially better (they almost finish fourth; the teams that spend heaviest on hitters almost finish seventh). This despite the fact that only one of the five most expensive pitchers -- Franco \$42 (Doors), Dave Smith \$40 (Three Scrooges), Lee Smith \$39 (Scratchers), Myers \$35 (Double Play) and Righetti \$31 (Shamrocks) -- lived up to his billing.

The fact that no starting pitcher breaks into the top five is one sure indication that these owners have been around the block before.

Another is the money they spend all told: \$2590, only \$10 left over at the end. The Prima Donnas grabbed the ring in the crapshoot -- DeJesus \$1, Lancaster \$1, Trevor Wilson \$1, Harnsich \$1 -- and had a dollar to spare.
